

Day 37

JavaScript
THE LANGUAGE OF THE WEB

Local Storage & related methods:

What is localStorage?

localStorage is a built-in browser storage where you can save data permanently. The data:

- stays even after you close or reopen the browser
- is stored on your computer
- uses key–value pairs
- stores strings only

Why do we use localStorage?

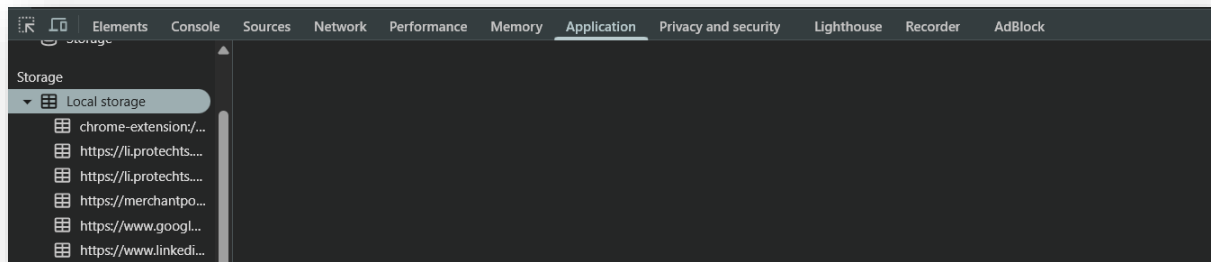

To remember things like:

- theme (dark/light)
- username
- settings
- form data
- cart items
- tokens (not recommended for sensitive data)

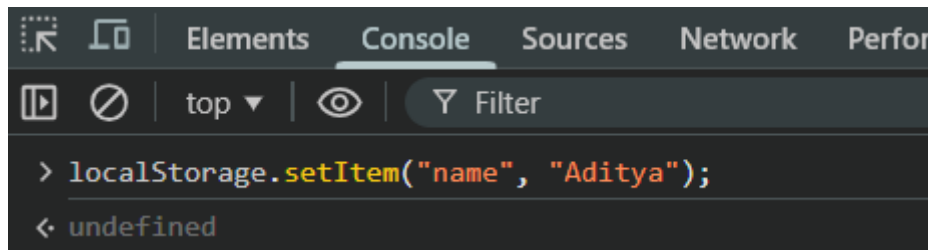

Main Methods of localStorage

Method	What it does
setItem(key, value)	Save data
getItem(key)	Read data
removeItem(key)	Delete one item
clear()	Delete all items
key(index)	Get key name by index
length	How many items stored

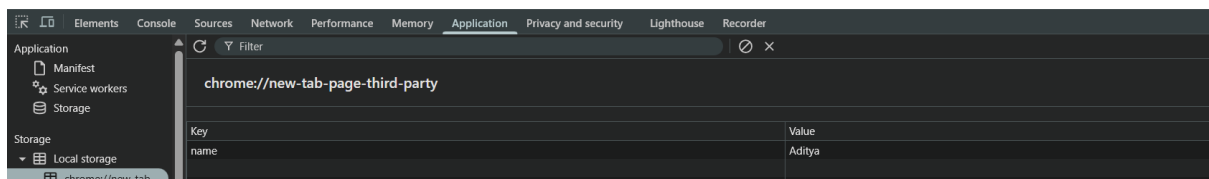

Where can I find the local storage in the website?

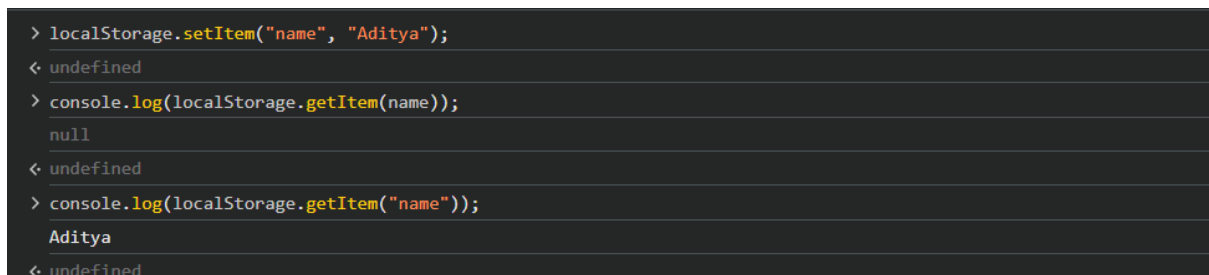

Now, in order to add the items in the local storage we uses “.setItem”:

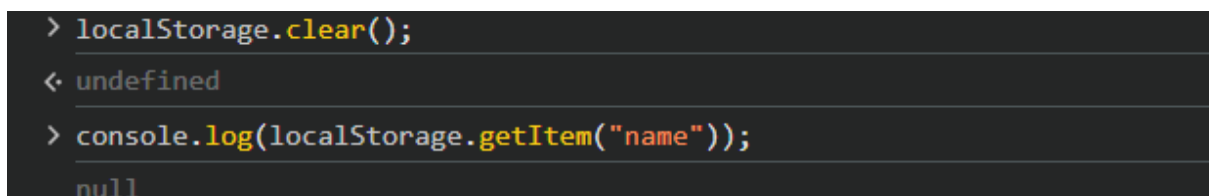

We can see that we did it successfully in the “Application” section:

Example: to get the value at the key we use the “.getItem”

Example: to clear the local storage we can use the “.clear()”:

Example: to get the length of the local storage we uses “.length”:

```
> localStorage.setItem("name", "Aditya");  
⏪ undefined  
> localStorage.length  
⏪ 1
```

Important Points About localStorage (Short Summary)

- Data stays permanently until manually removed.
- Stores data as key–value pairs.
- Only stores strings, so objects must be JSON stringified.
- Has around 5–10 MB storage limit (much larger than cookies).
- Data is not sent to the server automatically (unlike cookies).
- Accessible only in the same domain.
- Should not store sensitive data (like passwords or tokens).
- Easy to use: `setItem()`, `getItem()`, `removeItem()`, `clear()`.
